I saw the opening for the engineering internship and wanted to reach out. With a Master's in Data Analytics Engineering and two years of Python development experience, I've spent a lot of time building automated workflows and managing data.

In my previous projects, I focused heavily on backend automation. For instance, I built a Celery based task queue that reduced document generation times from 45 minutes to under 10. While my recent professional work has been strictly on Python, I used MATLAB extensively during my academic projects and can easily spin back up on it. I also use Git daily and have experience configuring GitLab pipelines to automate testing.

And honestly, I actually enjoy writing technical documentation, whether that's using Markdown or LaTeX to detail system architectures. I'd love to help the team simplify these reporting and validation workflows.

Regards,
Giri
